%% FEUP THESIS STYLE for LaTeX2e
%% FEUP, JCL & JCF, Mon Oct 2 16:35:08 2017
%%
%% PLEASE send improvements to <jlopes@fe.up.pt> and to <jcf@fe.up.pt>
%%
```

The sources and PDF examples of the general style of the FEUP dissertations can be found at <~/jlopes/tutoriais/feup-teses/>, that can also be downloaded from archive file [feup-teses.zip](#).

The materials related to the MIEIC preparation of dissertations are available in the directory <~/jlopes/tutoriais/mieic-distrib/>, that can also be downloaded from archive file [mieic-distrib.zip](#).

Opções Externas

- Língua: portugues (por omissão é usado o Inglês)
- Curso: mieec, mieic, miem, mesw (por omissão com grau especificado externamente)
- Unidade curricular: prep (para usar apenas na preparação da dissertação; só pode ser usada conjuntamente com mieec ou mieic)
- Formato: juri, final (por omissão provisional)
- Meio: onpaper (por omissão online)
- Ligações internas: backrefs (por omissão não é usada)

Private documentation is available in: [Developers' feupteses LaTeX style](#).

Usage

- Use pdflatex instead of latex.
- The main file is tese.tex (or thesis.tex). Please read the instructions inside.
- The style is defined in feupteses.sty.
- To re-create the example you may use the makefile, or else do:

```
pdflatex tese
bibtex tese
pdflatex tese
pdflatex tese
```

The file tese.pdf (or thesis.pdf) contains the result.

- The file plainnat-pt.bst is needed to process references in the format (author,date) in Portuguese, In English use plainnat.bst.
- The file alpha-pt.bst is needed to use alphabetic references.
- The character set used in the editing tool should be reported through the appropriate option:

```
\usepackage[latin1]{inputenc}
OR
\usepackage[utf8]{inputenc}
For the MAC use native encoding instead of UTF-8
\usepackage[applemac]{inputenc}
```

- Using the MiKTeX distribution, to have the correct hyphenation, select the Portuguese language in

"Start→ Programs→ MiKTeX 2→ MiKTeX Option".

- About the figures:

- pdf(la)tex works with the following formats: png, jpeg, tiff and pdf. Files produced by Metapost (which are written in a simplified version of Postscript) can also be used. To convert eps (Encapsulated Postscript) figures to pdf, the `epstopdf` program can be used. To remove existing space around pdf figures, `pdfcrop` can be used.
- To use the same eps figures with `pdflatex` and `latex`, as well as using figures created with the package `pstricks`, the package `pst-pdf.sty` can be used (It is justified only in very special cases!)
- To automate the calls to `latex`, `bibtex`, etc. the auxiliary program `latexmk` can be used. It is available in TeXlive and MikTeX (<http://texcatalogue.sarovar.org/entries/latexmk.html>).
