## MAIN SCIENTIFIC AREA OF RESEARCH AND OTHER AREAS OF INTEREST

The main research interest is in *Real-Time Communication* and related traffic scheduling techniques. Particular attention is given to operational flexibility of communications and all the problems that arise when combining it with timeliness and safety guarantees, targeting the support for dynamic reconfiguration, composability and Quality-of-Service management. Two main lines have been explored, namely communications using wired networks that allow strong control over bandwidth usage, and wireless communications for teams of cooperating autonomous agents that tolerate uncontrollable interference. The former line focuses on protocols for dynamic and adaptive network resource reservations using hierarchical scheduling and resource management techniques. The latter focuses on distributed protocols that adapt to interference and reconfigure according to current needs, aiming to improve the effective usage of the wireless channel.

Other fields of interest are *Real-Time Operating Systems*, particularly task scheduling, *Autonomous Mobile Robotics*, concerning internal hardware/software control architectures, and *Teaching of Electronics and Computer Science*, mainly by means of students competitions and other hands-on activities.
